Selection of a combination of certain filter options might cause an abnormal termination of the DB2® subsystem

A serious problem in the following products requires immediate attention:

- APPTUNE for DB2
- SQL Performance for DB2

**Issue**

An abnormal termination of the DB2 subsystem as the result of a storage overlay might occur when an active APPTUNE filter specifies a value of Y for both of the following options in the same filter row:

- the resource-saving option, Sample data with extrapolation
- the exception threshold option, Exception-only roll-ups

**Resolution**

The fix for this issue is pending. BMC plans to reissue this notice when the fix is available.

As a workaround, do not set both of these filter options to Y.
